

Curved Machine Table Fit

On all of our tables when the machine slopes downward by more than 1/4" we will bring the table up over the machine to help close any gaps or holes.

It is very important to have the entire table flush and level with the top of the free arm at the needle, so it is important to have the legs on the table for proper fitting. If the table is even 1/8" lower than this point it can cause the table to hit the machine and lift up on the right side.

Bringing the table cut out farther out will only create a larger dip and gap between the machine and table as the machine keeps sloping creating a larger drop off. Our main goal is to create the smoothest, flattest sewing surface, which unfortunately means that the bobbin case can be covered sometimes as lowering the table will cause a bump from the table to the needle. We realize we cannot make everyone happy by our standard placement which is why we do offer custom placing if this is not to your satisfaction. We have an additional \$25 design fee to change the cut out placement on a standardized part.
